

DualAttentionResNet1D

Federated Learning Protocol (per round)

Parameter Partitioning

Client Steps Each Round

- ① Load θ_{global} (local positions = 0 from server)
- ② Restore ϕ_k (overwrite with own local params)
- ③ Train all params jointly (single BCELoss)
- ④ Extract updated ϕ_k
- ⑤ Zero local positions → clean θ_{global} serialization
- ⑥ Upload [θ_{global} (local=0), ϕ_k , n_k]
